(Candidate of physico-mathematical sciences) ORG: none TITLE: Production of intense 10-7-10-8 sec light flares by means of spark discharges SOURCE: AN SSSR. Komissiya po nauchnoy fotografii i kinematografii. Uspekhi nauchnoy fotografii, v. 9, 1964. Vysokoskorostnaya fotografiya i kinematografiya (High-speed photography and cinematography), 153-158 and insert facing page 168 TOPIC TAGS: light source, electric discharge, gas discharge, argon, nitrogen, helium ABSTRACT: Several researchers discussed recently the production of light flares shorter than 10⁻⁷ sec by means of spark discharges. However, the question concerning the maximum intensity of such flares was left open. The present paper reports on the studies of physical conditions which determine the relationship between the energy fed into the discharge gap and the duration and luminous intensity of the resulting flare. The authors discuss in a semiempirical manner the process of liberation of electrical energy within the spark discharge channel, present diagrams showing the changes in time of electrical characteristics of spark discharges in air (in particular of the changes of the specific and total spark resistance within the channel), survey the methods for the shortening of the duration of the light flare and present experimental results (summarized in Fig. 1) for the cases of spark discharges in argon, nitrogen, and helium. 1/2 Card

TITLE: Time variation of the intensity of stimulated radiation in

various lateral modes

SOURCE: Zh. eksper. i teor. fiz., v. 46, no. 4, 1964, 1182-1187

TOPIC TAGS: stimulated radiation, radiation intensity, radiation intensity variation, lateral radiation mode, radiation intensity time variation, axial radiation mode, lateral mode generation, axial mode generation, stimulated radiation, neodymium activated glass, activated glass, resonator, polarized radiation

ABSTRACT: Spatial and time relationships between the axial and some lateral modes of stimulated radiation were investigated by using an apparatus in which the emission from a neodymium glass ($\lambda=1.06~\mu$) is directed toward a lens in the focal plane of which is the photomistathode of an image converter. The optical system with its auxiliary photographic system is shown in Fig. 1 of the Enclosure for a case

Card. 1/4 2

ACCESSION NO. AP4031135 wherein the emission leaving the glass specimen is separated into two beams. Fig. 2 shows the distribution of various oscillation modes. A comparison of the data obtained with determinations made by an analytical formula connecting the wave number of a vector with the linear-resonator dimensions shows that the theory of resonators does not explain all the data obtained. However, the importance of polarized radiation in the lateral modes is emphasized. Original art. has: 5 figures and 4 formulas. ASSOCIATION: Gosudarstvenny*y opticheskiy institut im. S. I. TITIE: Effect of resonator mirror alignment on generation conditions in neodymium activated glass

SOURCE: Zhurnal prikladnoy spektroskopii, v. 2, no. 5, 1965, 415-417

TOPIC TAGS: laser optics, neodymium laser, glass laser, mirror alignment

ABSTRACT: The effect of rescnator mirror alignment on energy, emission threshold, angular distribution, end distribution, and coherence in specimens of neodymium-activated glass was investigated. Glass specimens 8,10, and 15 mm in diameter and 67-120 mm long were placed in the resonator with 90% reflective dielectric-coated mirrors set 1 m apert. The maximum energy output from the laser was 2-3 joules. It was found that misalignment of one of the external mirrors reduced the emitted energy, and increased the emission threshold while the pumping energy remained constant. For misalignment of less than 15", there was no change in angular distribution within the experimental error. At greater misalignment, the angular dis-

Card 1/2

L 1730-66

ACCESSION NR: AP5016044

tribution becomes asymmetric. Strong pumping produces even illumination over the entire end of a neodymium rod when alignment is perfect. When misalignment reaches 20-30", bands appear which coincide with the axis of rotation of the mirror. The interference pattern was not disturbed by misalignment, which indicates that coherence is preserved. Orig. art. has: 4 figures and 1 table.

Lyubimov, V. v. 44 Polarization of the stimulated radiation of neodymium-activated glass TITLE: SOURCE: Zhurnal prikladnoy spektroskopii, v. 3, no. 2, 1965, 171-172 TOPIC TAGS: light polarization, polarized light, polarization, stimulated radiation, resonator, laser, neodymium doped glass, glass, neodymium ABSTRACT: The high losses caused by the polarizer can be avoided by using instead a glass plate whose angle to the axis of the instrument can be varied. The glass plate, which is placed between the neodymium glass rod and the output window, affects the efficiency of the resonator by determining the polarization plane of light oscillations. During experiments, the emerging beam was split by a halftransparent mirror, and the intensity of the two components was compared on a twochannel oscillograph. The measurements showed that if the glass plate is inclined at a small angle to the axis of the resonator, an almost complete polarization of the stimulated radiation can be obtained without involving great losses of energy. in series reduces the amplification of optical pumping, owing to the appearance of free generation of the whole channel. This difficulty can be eliminated by introducing, between the rods, optical decoupling filters made of uranyl glass. The filters, together with the operating rods, are placed in the laser illuminators and are pumped simultaneously with the rod. The optical density of the filter is selected in such a way that at maximum pumping no free generation appears in the laser channel; when the filters are illuminated at the moment when maximum Q for the resonator is reached, one light pulse is generated. By introducing optical decoupling, emission with an energy of 90 joules at 10^{-7} sec duration was obtained from one channel of the laser. The angular distribution of generated radiation improves as the optical pumping increases. Synchronous inclusion of two laser channels was obtained by appropriate adjustment of the laser elements. The time spread of the pulses emitted by both channels did not exceed 10^{-8} sec. With the simultaneous inclusion of two channels, a light pulse with an energy of 180 joules (corresponding to an emission intensity of 1.5 to 2 hw) was generated.

ORG: none TITLE: Use of a laser operating in the spike mode to obtain a high-temperature plasma 2/ SOURCE: Zhurnal eksperimental'ny i teoreticheskoy fiziki. Pis'ma v redaktsiyu. Prilozheniye, v. 3, no. 8, 1966, 316-318 TOTPIC TAGS: laser application, laser pulsation, neodymium glass, high temperature plasma, discharge plasma, gas ionization ABSTRACT: Since the use of a laser for gas ionization or production of a hightemperature plasma is usually limited to light pulses of duration 10-7-10-8 sec. and for certain applications, say to accelerate chemical reactions, it may be of interest to obtain longer action of the electromagnetic field of the light wave on the plasma, the authors have experimented with ionization of air with the aid of radiation from a laser operating in the spike mode, with total generation duration of about one millisecond. The neodynium-glass laser used in the investigation yielded light pulses with energy 800-1400 J. Neodynium-glass rods of 45 mm diam-Card 1/2

L 20618-66 ACC NR: AP6012184 eter and 600 mm long were used, with 2 and 4 per cent concentration of Nd203. elliptic illuminator with tix conjugate ellipses and straight pump flash lamps was used. The average laser radiation power, at a flash duration 0.8-1.2 msec, was 1-2 Mw, but, taking into account the off-duty factor between spikes, the maximum radiation power could reach 10-30 Mw. When this radiation was focused in air with a 100 mm focus lens a power density 1-3 GW/cm² and a field intensity of the order of 107 v/cm were obtained, enough to produce a high-temperature plasma in air. Photographs show that the plasma produced by the gas breakdown is optically opaque and that the laser emission of 1.06 μ wavelength is absorbed in the thin front layer of the cloud. TITLE: Post-operating liquid Q-switch shutter for neodymium glass laser

SOURCE: AN SSSR. Doklady, v. 167, no. 3, 1966, 547-548.

TOPIC TAGS: laser Q switch, solid state laser, neodymium glass laser

ABSTRACT: An investigation was made of the use of 3,3-diethyl-9,11,15,17-dineopentylenethiapentacarbocyanine iodide dye as a fast-operating shutter in a glass laser with a trivalent neodymium ion as activator. The emission falls on the longwave edge of the absorption band of the dye, whose maximum is at 950 mm. A neodymium glass rod 15 mm in diameter and 240 mm in length was used. The dye in a plane-parallel cuvette 20 mm long, was placed inside the resonator, which had external mirrors spaced at 1 m. The cuvette was situated between the generating rod and the exit mirror. The giant pulse energy was 1.5 joule, and the duration of the pulse did not exceed 25—30 x 10-9 sec. The laser spectrum in transition to a single mode narrowed from 50 to 6—8 Å. Both the threshold of giant pulse generation and its energy depended on the optical density of the solution. The single pulse generation appeared when the concentration of the solution was larger than 4 x 10-5 mol/1. At lower concentrations, free generation was observed. The energy of the single pulse

P.; Isayenko, V. I.; Luizova, L. A.; Shorokhov, O. A. AUTHOR: ORG: none TITLE: Losses in a resonator when the stimulated emission spectrum of Nd3+ in glass is narrowed SOURCE: Optika i spektroskopiya, v. 20, no. 6, 1966, 963-969 TOPIC TAGS: laser emission, emission spectrum, neodymium, interferometer, RESONATOR ABSTRACT: The results of a study of the losses introduced by a Fabry-Perot interferometer to the intensity of the stimulated emission of a neodymium glass laser are presented. The spectral emission band is narrowed by introducing a selective system, in the form of a interferometer, into the resonator. The experimental equipment is illustrated and described in detail. The results indicate that the emission spectrum is significantly narrowed as the coefficient of reflection of the plate is increased (1 to 2 Å at 60 to 80% reflectivity). When the coefficient of reflection is low, the energy generated is 70% that obtained without selection and remains so until reflection reaches 80%, whereupon it drops rapidly. Losses due to various instrument components are described and their respective magnitudes estimated. Orig. art. has: 3 [14] OTH REF: 004 formulas, 6 figures. TITIE: Optical quantum generators (lasers) by Kats, M. L., Kovner, M. A., and Sidorov, N. K.	
SOURCE: Optika i spektroskopiya, v. 19, no. 1, 1965, 160	
TOPIC TAGS: quantum generator, ruby laser	
ABSTRACT: The book under review has nine chapters devoted to the general theory of radiation; the general theory of generators; the practical application of lasers; and descriptions of ruby lasers, fluorite lasers, glass lasers, gas lasers, organic and complex compound lasers, and semiconductor lasers. The book appears to have merit in presenting a somewhat exhaustive collection of articles in the field up to the middle of 1963, but it is highly criticized for typographical and terminological errors. It is even suggested that some of the material is incorrect of intentionally misused to give an appearance of knowledgeability in the field. [JPRS]

TITLE: A 6-Gw neodymium glass laser

SOURCE: Optiko-mekhanicheskaya promyshlennost', no. 12, 1966, 65

TOPIC TAGS: solid state laser, neodymium, glass, banks giant pulse laser, Q switching, passive switching, polyacthine dye che

ABSTRACT: A 6-Gw neodymium glass laser with a simple phototropic Q-switch is described. The laser consists of three cylindrical rods in series, each 250 mm long and 45 mm in diameter. Each rod is placed in a multielliptic: reflector and is pumped by six direct flashlamps. The external cavity consists of one 99.6%-reflective dielectric mirror and a Q-switch placed between the first and second rods. The Q-switch consists of a cell made of two plane-parallel (error less than 1 min of arc) glass plates joined optically through a 1-cm-thick glass ring. The cell is filled with a polymethine-dye solution to a concentration at which the solution is 99% reflective at 1.06 µ. At maximum pumping energies, single 100-120-j, 20-nanosec pulses were obtained. By increasing the pumping energy or by

TITLE: Surface discharge as a source of intensive light flashes

SOURCE: Zhurnal prikladnoy spektroskopii, v. 5, no. 6, 1966, 712-717

TOPIC TAGS: surface discharge, spark discharge, light flash, light emission, emission spectrum

ABSTRACT: Luminous characteristics of the discharge channel over a titanium dioxide ceramic surface have been investigated in argon and xenon atmospheres. It was shown that the luminous emission intensity of the surface spark is 10 times greater than that of a free spark in air. The spectral distribution of the emission was measured. At extremely rigid conditions, the surface discharge is shown to emit as a blackbody with a temperature of 63,000K in argon and 40,000K in xenon.

Title	¿ Electrochemical investigation of passive iron
Periodical Abstract	The nature of electrochemical processes, taking place on a passive iron electrode in alkali solutions during anode polarization, was investigated and the effect of Cl-ions on these processes is explained. It was found that the capacitance of the double Fe-electrode layer, oxidized by heating in the air, measured at 20000 per/sec, is approximately 4 times lower than the capacitance of a metal free of oxides. The inhibiting effect of Cl-ions on the rapid oxygen adsorption and desorption process is explained. Twenty-two references: 18 USSR, 3 German and 1 USA. Tables; graphs.

TITLE: Gas-liquid chromatography of several silicohydrocarbons and paraffins.

SOURCE: Neftekhimiya, v. 4, no. 1, 1964, 137-141

TOPIC TAGS: gas liquid chromatography, paraffir, silicohydrocarbon, elution characteristic, retention time, chromatographic analysis

ABSTRACT: The elution characteristics of hydrocarbons and of silicohydrocarbons which are structurally similar analogs of the hydrocarbons were investigated in order to determine if mixtures of these materials can be identified chromatographically. The relative retention time of certain silicohydrocarbons and of paraffins on two stationary liquid phases of different polarity (polymethylphenylsiloxane (I) and polyethyleneglycol M.W. 154) (II)) was determined at different temperatures. The following homologous series of hydrocarbons and silicohydrocarbons were studied

Card 1/5

ACCESSION NR: AP4024410

(CH₂)₂ SI (CH₃)_n SI(CH₂)₂;

(CH₃)₂ SI (CH₃)_n;

(CH₃)₃ SI (CH₃)_n CH₃;

CH₃ (CH₃)_n CH₃;

Comparison of the retention time in phases I and II at 100 and 75C, respectively, is shown in fig. 1: The $(CH_2)_3$ Si $(CH_2)_n$ Si $(CH_3)_2$ type compounds can be identified in mixtures with paraffins and other silicohydrocarbons. By lowering the temperatures of the chromatographic columns the selected phases I and II can be used to identify the other series of compounds (fig. 2). It is recommended that the elution characteristic be determined on the different stationary phases at different temperatures and not at the same temperature. The logarithm of the relative retention time of the silicohydrocarbons can be represented as the sum of the partial values corresponding to the specific bonds: (V.G. Berezkin and V.S. Kruglikova, Neftekhimiya, No. 6, 845 (1962)):

TITLE: Design of automatic-control systems that contain nonstationary elements

SOURCE: AN SSSR. Izvestiya. Tekhniche kaya kibernetika, no. 2, 1964, 153-158

TOPIC TAGS: automatic control, nonstationary element automatic control, automatic control theory, automatic control design

ABSTRACT: No practical method of solving the problem of synthesizing a nonstationary-element-containing automatic-control system is known to the author. Up to now, the problem used to be solved by "freezing" the parameters (coefficients of equations) of nonstationary (variable-parameter) elements at convenient moments of time. When the rate-of-change of the parameters is comparable to that of the system transients, the freezing of coefficients may introduce serious errors. The author suggests a "qualitatively better" method,

Card 1/2

ACCESSION NR: AP4028987

viz., freezing of the weight function of the nonstationary element. The non-stationary element is approximately replaced, in the neighborhood of a point to, by a stationary element, thus reducing the entire system to a stationary system; the speed and nature of the time variation of the parameters determines the new form of the transfer function of the element which replaces the nonstationary element. "In conclusion, the author is deeply grateful to V. A. Besskerskiy and A. N. Gerasimov for their advice and help to the work." Orig. art. has: 3 figures and 45 formulas.

TITLE: Synthesizing variable-parameter systems by a "frozen" weight function

SOURCE: IVUZ. Priborostroyeniye, v. 7, no. 3, 1964, 33-38

TOPIC TAGS: automatic control, automatic control system, variable parameter automatic control, automatic control synthesis

ABSTRACT: Thus far, synthesizing variable-parameter automatic-control systems has been performed by "freezing" the system coefficients at suitable characteristic moments of time. However, when the rate-of-change of the coefficients is comparable to that of the transient process, the above method may yield incorrect results. Hence, "freezing" of the weight function of the system nonstationary unit is suggested instead. Weight functions are written for a system that comprises one stationary and one nonstationary unit; integral

AUTHOR: Besekerskiy,

TITLE: Design and calculation of unsteady-state automatic control systems by the "frozenresponse" method

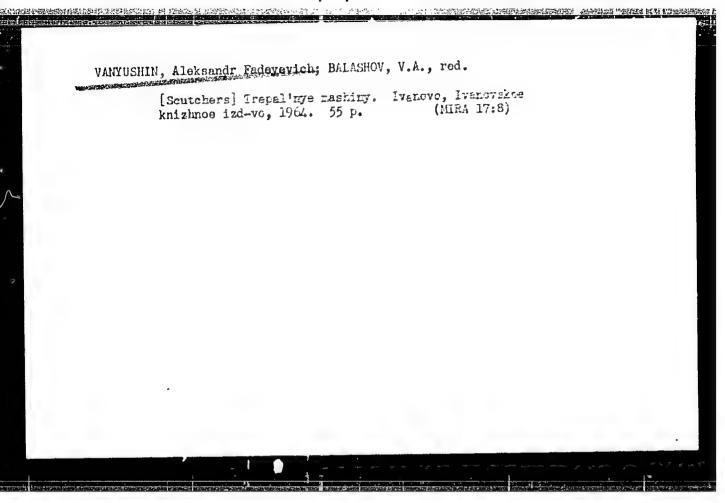

SOURCE: AN SSSR. Izvestiya. Tekhnicheskaya kibernetika, no. 2, 1966, 196-208

TOPIC TAGS: unsteady state system, automatic control system, circuit design, function analysis, differential equation

ABSTRACT: The complicated task of the synthesis of an unsteady-state system may be simplified and reduced to the task of synthesis of a steady-state system if the response of unsteady--state elements to a standard input signal, e.g. the step-function, is "frozen," as it were. This may be accomplished by the method of successive approximations, with the first approximation yielding fairly accurate results. The derivation of the subsequent approximations is associated with an increase in the order of the function W(p). (This function is equivalent to the transfer function W(p) of steady-state systemic.) Hence, it is expedient to simplify the form of the

APPROVED FOR RELEASE: 08/09/2001 CIA-RDP86-00513R001858610002-0"

ſ	ACC NR: AP60243	77						
signals received at the input of the unsteady-state element, i.e. to approximate them with simple functions. The synthesis of variable-parameter linear systems of this kind may also be accomplished by the fitting method if the solution within the separated segments is sought by freezing the responses of the unsteady-state element to a standard input signal. This method converges when the coefficients of the differential equations describing the system are piecewise-continuous and may be expanded into a Taylor series over a given interval of time. Thus, the problem of the synthesis of unsteady-state systems can be reduced to an algebraic problem. "In conclusion the authors wish to express their profound gratitude to Kh. L. Smolitskiy for assistance in writing Section 3 of the present article." Orig. art. has: 6 figures, 46 formulas.

doubts as to the accuracy of their relation to this family. By analogy, considerable differences in DNA composition between Bacterium morganii and P. vulgaris affirms that the relation of Bact. morganii to g. Proteus is scarcely strictly proven. RMA nucleotide composition possesses a considerably less expressed specificity of species and quite certain, although insignificant differences, uncovered only in distant species. Similarly, between the RMA and DNA compositions there is a known correlation, which expresses itself in the increase of the relationship guanylic acid + cytidylic acid/ adenylic acid + uridylic acid in RNA by the transition from species with a less significant quantine + cytosino/ adenine + thymine in DNA to species: 2/3

TITLE: A omparative Investigation of the Composition of Ribonucleic

Acids in Higher Plants

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 127, Nr 2,

pp 455 - 458 (USSR)

ABSTRACT: The composition mentioned in the title has hitherto been in-

vestigated only in several species (Refs 1-8). Conclusions cannot be drawn from these data to the composition of this acid (RNA) or to its variability limits in plants of different systematic groups. In the present paper the nucleotide composition of 28 plant species (representatives of 5 types, 6 classes, 27 and 25 families, Ref 9) was investigated. Seeds.

23 orders, and 25 families; Ref 9) was investigated. Seeds, pollens, and thallow material served for this purpose (supplied by M. A. Mazurenko, F. D. Kostik, and M. S. Chichagova). The ribomononucleotides were separated by a) electrophoresis, and

b) chromatographically a) The deliquescence of greater quanticard 1/3 ties of liquid (100 -400 pl) was prevented by two graphite-pencil-

stripes. The position (sequence) of the nucleotides from the cathode to the anode was the following: cytidylic-, adenylic-, guanylic-, and uridylic acid. The mobility of these nucleotides was similar to that of the publications (Ref 11). Considerable quantities of pigmented substances disturb in the hydrolysates of the RNA of many substances so that the determination of the nucleotides was only possible by electrophoresis on paper. Table 1 shows the results. They show that certain differences in the RNA composition may be reliably detected only between the representatives of plants classes which are most remote from one another. This points to a relatively low specifity of this composition in the higher plants. The investigated plants differ not only with respect to their systematic position and origin, but also to their ecology; there are arbores .-, shrublike-, herbaceous-, annual-, and perennial plants, culture plants with a specialized metabolism (fruit- and oil plants, cereals, gutta producers) as well as uncultivated plants, relic species as well as the representatives of the recent families. In spite of these differences their total RNA composition is strikingly similar. This shows that the RNA composition depends

A Comparative Investigation of the Composition of Ribonucleic Acids in Higher Plants

SOV/20-127-2-63/70

only little on the essential conditions for life of the plant organisms and changes only inconsiderably also in the course of their evolution. What is even more striking - the RNA composition is unusually similar to that of microorganisms and animals. Thus it is similar for all organisms. Therefore the nucleotide sequence in the RNA molecule chain must be investigated since the RNA specifity is apparently bound to be due mainly to this structural factor. There are 1 sable and 15 references,
